

Competitive, Market & Regulatory Deep-Dive: Positioning Privé Technologies' Structured Products Engine in Asia

TL;DR

- **The white space is real and defensible.** Nearly every incumbent (FinIQ, Contineo, Vontobel deritrade, Leonteq, Marex, Luma) is built around RFQ/pricing/execution or issuer distribution; almost none combine (a) fund-like factsheets and historical performance-proxy series for structured products (SPs), (b) probability-driven lifecycle/knock-out analytics with a next-best-offer (NBO) reinvestment engine, and (c) solver-based product construction from client holdings — inside a broader wealth platform. Privé should position as the **post-trade intelligence and reinvestment-capture layer** that sits on top of, not against, the execution rails banks already own.
- **Demand is at record highs and structurally concentrated in Asia's autocall/FCN flow.** Hong Kong's SFC-HKMA joint survey recorded a record HK\$6,073 billion of non-exchange-traded product sales in 2024 (+40% YoY), with structured products the top category at HK\$2,567 billion (42% of the total, up 30% YoY); APAC ex-China SP sales rose ~14% to an estimated US\$257.1bn. iCapital saw nearly US\$39bn of notes called on its platform in 2024 (73% of its callable book), proving the scale of the recurring reinvestment pool Privé's NBO engine targets.
- **Regulation is a tailwind for a compliance-guardrailed NBO.** Fresh 2024–2026 suitability actions (SFC/HKMA joint circular April 2024; a new 2025 thematic review; MAS's revised Fair Dealing Guidelines and complex-product reforms) plus the HKMA/SFC GenA.I. Sandbox++ (extended to asset & wealth management in March 2026) mean explainable, auditable AI recommendations are exactly what regulators want. Enter via **read-only analytics/data feed**, expand to lifecycle/NBO, then the builder.

Key Findings

1. Competitive white space. The incumbent field splits into three clusters: (i) **execution/RFQ multi-issuer platforms** (FinIQ, Contineo, Vontobel deritrade, Marex Agile, AG Delta) that price and trade but do minimal post-trade portfolio analytics; (ii) **issuer/manufacture tech** (Leonteq LynQs, Vontobel, Marex, Futura/Modelity) optimising their own production and distribution; and (iii) **US-centric advisor marketplaces** (Luma, Halo, iCapital/SIMON, StructrPro) with strong lifecycle tooling but little APAC presence and a US-product orientation. Privé's differentiators — fund-like factsheets + performance-proxy series, probability-of-KI/KO lifecycle projections tied to a next-best-offer engine, and a solver that reverse-engineers structures from a target outcome — are only partially matched by swissQuant (DeriRobo solver), Futura (maturity reinvestment) and StructrPro (US lifecycle analytics), and none of these is embedded in a full wealth platform serving APAC EAMs and banks.

2. Market size. Record and growing; autocallables/FCNs dominate Asia. Hong Kong structured product sales alone were HK\$2,567bn in 2024, with equity-linked products making up 67% of all

SPs sold (up from 61% in 2023). The EAM/independent segment — a core Privé beachhead — now manages ~US\$328bn across Singapore and Hong Kong (295 firms), growing ~12% p.a. through 2030, but the vast majority of firms (77% in Singapore, 72% in Hong Kong) manage under US\$1bn and lack build capacity, making them ideal SaaS buyers. [thewealthmosaic](#)

3. Regulation. Suitability, product due diligence and complex-product classification are under active regulatory scrutiny in both HK and Singapore, and AI recommendation engines now have an explicit sandbox and guidance regime. This favours a tool that makes SPs "explainable, monitorable and actionable" with an audit trail.

4. Consulting channel. Synpulse (100+ ecosystem partnerships, OpenWealth, Synpulse8 tech arm) and the Big Four run structured alliance/ecosystem models and publish heavily on wealth digitisation and AI — a natural co-sell route, especially around Avaloq/Temenos/FNZ core-banking transformations where SP capability is in scope.

5. Pricing. The market is opaque (nearly all vendors are "contact sales"), which is an opportunity: Privé already uses a one-time implementation fee + recurring annual SaaS subscription (plus AUM-based and per-product options). Generic wealthtech benchmarks: RIA implementation \$5k-\$30k; large-institution implementation \$50k-\$1m+. [Advisorengine](#)

Details

1. Competitive Landscape

FinIQ (Singapore). The APAC market leader in SP execution technology; won Asian Private Banker's Best Structured Products Solution for both 2024 and 2025. Flagship **EQ Connect** (equity-linked) and **FXD Connect** (FX) provide multi-dealer connectivity to 45+ liquidity providers, front-to-back automation (onboarding, suitability, OMS, lifecycle, reconciliation), and low-code configurability. Clients include LGT, Deutsche Bank WM and Bank of East Asia; ~15 private banks and 20+ issuers price on the platform; it has a Middle East footprint (Mashreq, Emirates NBD, Dubai office). Its 2022-launched **Orchestrator** IB-distribution platform is gaining traction in APAC, EMEA and the Americas. Critically, FinIQ **already offers modular SaaS for adjacencies Privé targets**: "FinIQ Docgen" (Key Fact Sheet auto-generation) and "FinIQ Life Cycle Analytics (LCA)." In 2025-26 FinIQ stated its AI strategy is focused on "workflow optimisation, analytics and operational efficiency rather than investment recommendations" — deliberately *ceding* the recommendation/NBO space Privé occupies. **Strength**: entrenched execution rails, bank-grade integration. **Weakness**: execution-centric; not a portfolio/risk-analytics or advice engine; no solver-from-target or NBO. [Asian Private Banker + 2](#)

Contineo (Hong Kong). Consortium-backed (founded 2015 by AG Delta, Barclays, BNP, Goldman, HSBC, JP Morgan, SG and Julius Baer) open messaging network / "messaging hub" for price discovery between buy- and sell-side. It historically held roughly half the HK/SG market alongside FinIQ (a market bankers once sized at ~US\$180bn/yr notional). **Strength**: neutral messaging standard, issuer breadth. **Weakness**: connectivity/price-discovery only — no post-trade analytics, factsheets, lifecycle projection or construction.

Leonteq (LynQs). Swiss issuer-fintech; its Partners Platform / LynQs offers an all-in-one white-label of Leonteq's own SP value chain (structuring, pricing, docs, issuance, settlement, risk, distribution). **Strength:** deep manufacturing IP — "we give them our calculator." **Weakness:** fundamentally an issuer's distribution tool; conflicted as a neutral analytics lens; the buy-side adopts Leonteq's rails rather than an independent risk view.

Vontobel (deritrade / cosmofunding / derinet). deritrade is a leading multi-issuer platform (11 issuers, >70% of Swiss exchange-traded SP volume; investments from CHF 10,000). "deritrade Smart Guide" uses analytics on platform data to suggest bespoke product alternatives and market opportunities — the closest incumbent to an ideation nudge, but tied to Vontobel issuance and Swiss/European-centric. cosmofunding is a separate money-market/private-placement platform (not directly competitive). Vontobel won SRP "Best House, Hong Kong" for automated CLNs priced from US\$100,000. **Weakness:** issuer-aligned; not a neutral buy-side portfolio-risk/lifecycle layer. (Structuredretailproducts)

Marex Solutions (Agile). Non-bank issuer with a fast-growing proprietary **Agile** platform: structure, price and execute across 1,000+ underlyings and asset classes, instant documentation, click-and-trade, secondary market. Over 20,000 SPs issued; it launched its US business in Nov 2025 (targeting the ~US\$220bn 2025 US market, per SPI/WSD). Local teams in Singapore, London, Paris, Milan and NY. **Strength:** credit diversification (non-bank issuer), pricing breadth, lifecycle secondary support. **Weakness:** it is an issuer's own execution/issuance platform, not independent multi-book analytics or NBO. (Marex)

AG Delta (Singapore/HK). Long-standing Asian digital-wealth + SP execution platform (founded 2004); over US\$1.5tn in transactions handled; RegTech across 15 jurisdictions; AI/data analytics for "relevant investment opportunities"; deployed at Standard Chartered, Thirdrock and others; named "best wealth fintech" by regulators in 2018. **Strength:** APAC-native, suitability/compliance-aware, advisory + execution. **Weakness:** execution/distribution-centric; no fund-like factsheets/performance-proxy series or solver-based construction; momentum has waned relative to FinIQ. (LinkedIn)

swissQuant (DeriRobo / ImpaQt). The closest match to Privé's **solver**: DeriRobo "designs for each individual wealth management client the optimal structured product" in one click, using client risk profile, allocations and views, and uses AI to "unlock hidden client preferences." It is embedded in the ImpaQt wealth software (~30 banks) and also has post-trade/lifecycle and risk modules for non-listed products. **Strength:** genuine optimisation/solver + risk engine, Swiss quant credibility. **Weakness:** primary-market product-optimisation focus; Europe-centric; not a broad APAC wealth platform; less emphasis on fund-like factsheet/proxy series or maturity-event NBO at book level.

Futura (formerly Modelity Marketplace). End-to-end issue/structure/price/distribute platform enabling buy-side institutions (retail banks especially) to issue their own products from as little as US\$5,000 notional with auto-hedging to investment banks; AI manages the "full lifecycle from pre-trade ideation to maturity." It explicitly markets **maturity reinvestment / next-best-offer**: "At

maturity, offer new bespoke investments that reflect market conditions and the evolving needs of your clients... across your entire client base." Parent Modelity historically offered SP transparency/explanation analytics (historical performance, stress tests, VaR, Monte-Carlo). **Strength:** closest philosophical match on reinvestment-at-maturity and democratisation; AI lifecycle. **Weakness:** issuance-and-distribution model (buy-side becomes issuer); less a neutral analytics/risk overlay on existing books; limited APAC footprint. (Futura)

Modelity Technologies. SP-analytics heritage — a sales module for "structured products transparency and explanation" with historical performance, stress tests, VaR and Monte-Carlo outputs. Overlaps Privé's factsheet/analytics claim but is an older, narrower toolset now largely subsumed into the Futura story.

vestr (Switzerland). White-label lifecycle/portfolio-management for **Actively Managed Certificates (AMCs)** and CLNs — NAV calc, rebalancing, audit, reporting (e.g., Julius Baer's "EPIC"); integrates with FA, Sophis and Avaloq. Adjacent, not directly competitive: it manages AMC lifecycles, not autocall KI/KO analytics or SP factsheets/solver. **Relevance:** signals demand for lifecycle automation and audit trails.

Luma Financial Technologies (US). Largest independent US multi-issuer SP + annuity + insurance platform; closed a **US\$63m Series C on 16 April 2025 led by Sixth Street Growth**, with existing strategic investors Bank of America, Morgan Stanley, UBS and TD Bank Group participating (Sixth Street's Alex Goodman joined the board). Full lifecycle: education/certification, creation/pricing, order entry, post-trade actions, event tracking, on-demand performance reporting and advanced portfolio analytics; integrates with BlackRock Aladdin Wealth. Offices include Lisbon and Switzerland; expanding across the US, Canada, EMEA and LATAM. **Strength:** deepest lifecycle + analytics + capital. **Weakness:** US/annuity-centric, limited APAC presence; a well-funded future entrant to watch — a reason for Privé to establish APAC defensibility fast.

Halo Investing (US). Multi-issuer tech platform for structured notes, market-linked CDs, buffered ETFs and annuities; advisor lifecycle tools track observation/maturity dates so advisors are "ready when the maturity date arrives." Its affiliated RIA charges up to a 1.5% advisory fee. **Weakness:** US advisor market, note-marketplace model; thin APAC. (Halo Investing)

iCapital / SIMON. iCapital acquired SIMON Markets (2022; SIMON had >US\$48bn 2021 issuance, 50+ manufacturers, 100k+ advisors). SIMON Spectrum offers multi-dimensional allocation/portfolio-construction analysis and lifecycle management. iCapital's **2024 Structured Investments Insights Report** is the single best reinvestment datapoint (below). **Weakness:** US wealth-channel focus; alternatives-led. (Business Wire)

Numerix. Pricing/risk analytics engine (part of the original Leonteq/DBS/Avaloq IPDS); a quant library rather than a distribution or advice platform — a potential *component* competitor/partner for the pricing math, not the workflow.

LPA (Lucht Probst Associates). European capital-markets/SP advisory + technology (Modelity's Ayal Leibowitz was formerly LPA's CIO); pre-trade/structuring and regulatory tooling, Europe-centric.

Kidbrooke. Nordic "KidbrookeONE" API-first financial-analytics/simulation engine (financial simulation, risk, planning) — adjacent analytics infrastructure, not SP-specific lifecycle/NBO.

StructrPro (SRP + FVC). The closest analytics analogue: a **structured-product lifecycle-management portal** built on SRP's ~40,000–70,000-product US database + FVC analytics — independent valuations, stress tests, lifecycle data, portfolio analysis, and headline metrics on "current performance, future outcomes and portfolio reinvestment." **Strength:** exactly the factsheet/performance/lifecycle analytics Privé claims, with authoritative data. **Weakness:** US-only coverage, whole-of-market/issuer-analysis orientation, not embedded in an advisory/execution workflow, no solver or client-holdings-driven NBO. It is both a competitive reference and a potential data partner. (Structuredretailproducts) (Structuredretailproducts)

Supply-side context. BMO launched a regional APAC equity-derivatives desk (2024) issuing ELNs, accumulators and decumulators — evidence of expanding manufacturer supply feeding distributor demand for tooling.

White-space summary. No incumbent convincingly combines all three Privé pillars in one APAC-native, issuer-neutral, buy-side platform: (1) **fund-like factsheets + historical performance-proxy series + delta/exposure breakdown deliverable as a data feed** (StructrPro does US analytics but not as an embedded feed/workflow; Modelity/Futura touch analytics but are issuer-tied); (2) **probability-weighted lifecycle projection + book-level NBO/reinvestment capture** (Futura and Halo touch maturity reinvestment; iCapital/StructrPro quantify calls; none tie probability-of-KI/KO to a compliant, book-wide next-best-offer for RMs); and (3) **solver from a target outcome and from client holdings** (only swissQuant's DeriRobo genuinely solves, and it is primary-market/Europe-centric). Privé's compounding advantage is that these sit inside its wider onboarding/CRM/portfolio-construction/monitoring suite, which already includes a proprietary risk engine modelling SP embedded exposures, payoff structures and sensitivities.

2. Market Size & Demand Evidence

- **Hong Kong (SFC-HKMA Joint Survey 2024, published 4 Sept 2025):** total non-exchange-traded investment product sales reached a record HK\$6,073bn, "surged 40% year-on-year"; the number of selling firms rose 9% to a new high of 414. **Structured products were the top category at HK\$2,567bn — 42% of the aggregate, up 30% YoY.** Within SPs, **equity-linked products made up 67% of all SPs sold in 2024, up from 61% in 2023 (~HK\$1,720bn).** Transaction amounts for SPs are measured as maximum exposure at point of sale.
- **APAC ex-China (SRP "Spotlight on Asia Pacific"):** SP sales rose nearly 14% in 2024 to an estimated **US\$257.1bn**, from **117,893 products** issued across HK, Taiwan, South Korea, Japan and Thailand (up from 95,594 in 2023).

- **Korea:** ELS/autocall volumes are volatile — monthly volume rebounded to KRW4.78tn (US\$3.4bn) in May 2024 (+12% MoM); Jan 2025 ELS sales were KRW4.55tn (US\$3.1bn), −34% YoY; a Feb 2025 recovery saw +52%/+55% YoY for principal-at-risk / fully-protected products. (Structuredretailproducts)
- **Japan:** Uridashi autocallable notes declined into H2 2024 under a tightened regulatory environment — private placements −19% to JPY1.05tn; public offerings −57% to JPY5.9bn. (Structuredretailproducts)
- **Malaysia:** Kenanga logged a near-tenfold increase in HSI-linked listed structured-warrant turnover in 2024.
- **Payoff dominance:** Autocalls dominate globally and in APAC (Athena/Phoenix autocalls were 34% of total sales in Q1 2026 per SRP), and FCNs and AQDQ (accumulator/decumulator) structures dominate Asian private-banking demand.
- **EAM/IAM segment (Privé beachhead):** Synpulse's "External Asset Management in Singapore and Hong Kong" report (26 May 2026, with AIWM Singapore and the Family Office Association HK): **295 EAM firms managing ~US\$328bn (7–9% of HNW wealth), with ~12% estimated annual AUM growth through 2030. Crucially, 77% of Singapore EAMs and 72% of Hong Kong EAMs manage under US\$1bn, and more than 80% now operate hybrid (advisory + discretionary + fund-based) models** — "technology is now decisive." Broader context: HK Type 9 licensees +4% to 2,212 (SFC 2024); Singapore licensed FMCs rose to ~1,298–1,300; HK private-banking/PWM AUM was HK\$10.4tn end-2024 (+15% YoY) across 46 PB/PWM banks. (Reed Smith)
- **Reinvestment / asset-leakage (the NBO thesis):** iCapital's 2024 Structured Investments Insights Report is the strongest quant anchor: "**we saw nearly \$39 billion in called structures, or 73% of the total outstanding callable population... the average duration of callable products that triggered during 2024 was 12 months**" (the Russell 2000 was an underlier in \$21.4bn of those calls), and reinvested proceeds helped drive a record **US\$84.5bn of SI sales (+42% YoY)**. FVC/StructrPro identifies a "**clustering effect**" — in rising markets a large number of autocalls knock out in a short window, "mak[ing] available a large amount of funds to be reinvested from investors... that have just had a positive experience," whereas "in times of down markets... money is not freed up as quickly." A fund-of-SPs example rolled 5-of-5 maturities into new autocalls and turned over ~40% of AUM in H1 2024. Issuer economics assume the roll: autocalls give issuers "the chance to issue another product to the same investor." **Caveat:** the SEC has sanctioned a broker-dealer for improperly encouraging early resale/reinvestment to generate fees — so any NBO must be suitability-gated. (iCapital + 3)

3. Regulatory Landscape & Suitability Pressure

- **SFC-HKMA Joint Circular (18 April 2024):** a review of the distribution of non-exchange-traded products found deficiencies in product due diligence (PDD) and suitability, with "particular focus on structured products." Findings included staff unable to explain

accumulator mechanics/risks and one firm misclassifying an FX target-redemption forward (FX-TARF) as "medium risk" despite accumulator-like unlimited-loss potential.

- **New concurrent thematic review (2025):** the SFC and HKMA launched a fresh review of collective-investment-scheme distribution (policies, systems, controls, PDD, suitability, client information) after the 2024 survey showed CIS sales +76% YoY — a signal that distribution-conduct scrutiny is intensifying, not easing.
- **Singapore (MAS):** the **Fair Dealing Guidelines were revised on 30 May 2024** to apply to all financial institutions and all products, covering product design and governance. MAS ran a consultation to enhance Product Highlights Sheets and streamline the complex-products framework; **on 15 May 2026 MAS concluded** it will remove the mandatory financial-advice requirement for complex products except for "Selected Clients" (investors assessed to lack adequate experience/knowledge) — shifting toward opt-in advice with clearer, red-banded disclosures. The complex-product regime dates to 2012; structured notes and derivatives are explicitly in scope.
- **AI / robo-recommendation guidance (positioning the NBO):** the HKMA issued AI principles in 2019 (governance/accountability, fairness, transparency/disclosure, data privacy) and Aug-2024 GenAI guidance for customer-facing activities (transparent, explainable, fair). The SFC's Nov-2024 circular on GenAI language models warns they may "amplify" existing risks. The **HKMA/Cyberport GenA.I. Sandbox launched Aug 2024** (first cohort of 15 use cases from 10 banks announced Dec 2024; second cohort of 27 use cases from 20 banks announced Oct 2025), and **GenA.I. Sandbox++ launched 5 March 2026 jointly with the SFC, IA and MPFA, explicitly extending to the asset & wealth management sector.** The Hong Kong Generative AI Technical and Application Guideline (DPO, April 2025, updated Dec 2025) stresses fairness, transparency, user choice and bias mitigation for recommendation engines. **Implication:** an explainable, auditable NBO with suitability guardrails is directly aligned with regulatory direction and could itself be a sandbox use case.

4. Consulting Partner Channel Intelligence

- **Synpulse** is the standout fit: over 1,000 staff across 21 offices, with **100+ ecosystem partnerships**; it founded and orchestrates the **OpenWealth Association** (API standardisation) and runs its tech arm **Synpulse8** (co-creation/digital connectivity). It publishes prolifically on APAC wealth transformation, Avaloq programme delivery ("most Avaloq programmes fail due to gaps in structure, governance..."), EAM growth and AI adoption — and partners with fintechs (BetterTradeOff, 3rd-Eyes) under a defined ecosystem model. Synpulse is already the user's named partner and produced the definitive EAM sizing report, making it an ideal co-author of Privé proof points and a warm route into both EAMs and banks. 
- **Big Four & others:** Deloitte named Privé Hong Kong's fastest-growing tech company (2018) — a warm historic tie worth reactivating. KPMG publishes the Hong Kong Private Wealth Management Report (documenting AUM growth and AI as the #1 client investment theme

in 2024). Deloitte/EY/KPMG/Capgemini/zeb/Alpha FMC run alliance programmes typically structured as referral/resell/co-delivery arrangements with revenue-share on implementation, and they embed vendor tools in core-banking transformations (Avaloq, Temenos, FNZ) where SP capability is frequently in scope. **Play:** position Privé as the SP-analytics/NBO module consultancies attach to Avaloq/Temenos/FNZ programmes, with the consultancy capturing systems-integration and change-management revenue.

5. Pricing Benchmarks

- **Opacity is the norm:** Luma, Halo (software), iCapital/SIMON, SRP/StructrPro, Bloomberg and Numerix all use "contact sales"/demo enterprise models — no public per-seat or AUM-bps figures exist. Luma and Halo are confirmed **subscription-based B2B** (Luma: subscriptions granting marketplace/tool access, plus predictive analytics). Halo's affiliated RIA charges a **maximum 1.5% advisory fee** — an AUM advisory fee, not a software price, and should not be reused as a software benchmark.
- **Privé's own model (to anchor land-and-expand): a one-time upfront implementation fee + recurring annual SaaS subscription** (covering "license to the software, maintenance, infrastructure costs, monitoring, support, security and updates"), plus, per its investor profile, (a) a recurring usage/license fee, (b) an AUM-based fee for robo-generated portfolios and (c) subscription/upfront fees for financial products — a structure that maps cleanly onto a tiered land-and-expand offer.
- **Generic wealthtech benchmarks (AdvisorEngine):** RIA one-time implementation \$5,000–\$30,000; large institutions \$50,000–\$1,000,000+. Advisory fees industry-wide run 1–2% of AUM, scaling down with size. SaaS best practice supports an "upfront implementation + higher recurring" hybrid for customised deployments. (Advisorengine) (Getmonetizely)
- **Packaging recommendation:** price the three tiers to match value and data intensity — (1) read-only analytics / market-data feed priced per-seat or as a flat data-feed licence (low-friction land); (2) lifecycle + NBO priced per-RM-seat with an optional bps-on-SP-AUM override to share in reinvestment upside; (3) builder/solver as a premium per-seat or per-desk module. Keep the tier-1 implementation fee modest to accelerate adoption.

Recommendations

Wedge / entry-point per segment (staged land-and-expand):

1. **EAMs/MFOs & family offices (fastest land):** lead with the **read-only factsheet + risk-analytics + data feed** tier. These 295 firms (~US\$328bn; ~72–77% sub-US\$1bn) cannot build this and need it for the very suitability/PDD obligations regulators are enforcing. Price low, prove value on real client books, then upsell lifecycle/NBO. Co-sell through Synpulse's EAM relationships.
2. **Retail-affluent & mid-tier private banks:** lead with **lifecycle management + NBO**, positioned around reinvestment-capture and RM productivity (anchor on the iCapital 73%-

called / US\$39bn datapoint and the FVC "clustering" thesis). Integrate alongside, not against, FinIQ/Contineo execution rails.

3. **Large private banks:** enter via **consulting-led transformation** (Synpulse/Deloitte) as the SP-analytics/NBO module in Avaloq/Temenos/FNZ programmes; the **builder/solver** is the flagship differentiator here.

Channel: formalise a Synpulse alliance (referral + co-delivery revenue-share; Privé as ecosystem partner) and re-engage Deloitte leveraging the FT-1000/fastest-growing history. Package Privé as an "attach" module to core-banking RFPs.

Compliance-first NBO: build explicit suitability gating, explainability and a full audit trail into the NBO from day one; apply to the **GenA.I. Sandbox++** (now open to asset & wealth management) as a flagship, regulator-endorsed use case. Explicitly avoid any design that could look like fee-driven churning (cf. the SEC early-resale sanction).

Proof points to build/cite: (1) a quantified reinvestment-capture case study (assets rolled at KI/KO vs. leakage) using a live client book; (2) an independent-valuation/factsheet accuracy benchmark vs. issuer marks; (3) a solver case turning a client holding into a compliant SP proposal in minutes; and (4) RM-productivity metrics (books managed per RM, response time at lifecycle events).

Benchmarks that would change the strategy: if FinIQ or Luma ships a genuine book-level NBO/solver in APAC, accelerate the builder/solver differentiation and lock in data-feed exclusivity; if MAS/HKMA materially tighten AI-recommendation rules, double down on the compliance-guardrail narrative as the moat; if EAM consolidation accelerates past the ~12% growth expectation, shift emphasis toward surviving scale players and consulting-led bank deals.

Caveats

- **SRP/StructrPro figures are proprietary** and some APAC numbers are SRP estimates (e.g., the US\$257.1bn APAC ex-China figure); HK figures use "maximum exposure at point of sale," not premium paid, so they are not directly comparable to premium-based sales elsewhere.
- **No public per-seat/AUM software pricing** exists for the main competitors; pricing recommendations rest on Privé's disclosed model plus generic wealthtech benchmarks, not competitor list prices.
- **No clean published "% of SP flow that is rollover"** statistic was found; the reinvestment thesis rests on strong proxies (iCapital's 73% called; the 40%-roll fund example; issuer economics) rather than a single APAC private-bank figure.
- **Some competitor descriptions rely on vendor self-description** (Futura, swissQuant, Marex, Vontobel) and older Contineo/AG Delta market-share commentary ("close to half the market" each) that predates the current landscape; treat share claims as directional.
- **Market-sizing CAGR figures** from syndicated market-research vendors should be treated as lower-confidence than regulator/SRP data.

- **MAS's May 2026 conclusion** is recent; the implementation timeline and the precise "Selected Clients" definition should be confirmed against the final MAS instrument before client-facing use.
